206715

Annual Report Of The Associate Professor In Charge  
Of The Sub Centre At Mennuthy(Kerala) under  
The All India Co-Ordinated Spices And  
Cashewnut Improvement Project  
For The Year 1975-1976.

KERALA AGRICULTURAL UNIVERSITY.  
MANNUTHY-680651  
TRICHUR.

206715

KAU/APR 1975-76

ANNUAL REPORT OF THE ASSOCIATE PROFESSOR IN CHARGE OF  
THE SUB CENTRE AT MANNUTHY (KERALA) UNDER THE ALL  
INDIA CO-ORDINATED SPICES AND CASHEWNUT IMPROVEMENT  
PROJECT FOR THE YEAR 1975-76

\*\*\*

1. Report Period : From 1st July 1975 to  
                          30th June 1976
2. Project Code No. : 176
3. Report No. : 5
4. Location:-

The Project was originally started at the Cashew Research Station, Anakkayam in Malappuram Dist. on 18.2.1972 and continued to function there till 30.4.1973. Since there was not enough area at Anakkayam for laying out all the field trials under the project, the headquarters of the project was subsequently shifted to the Vellanikkara Campus of the Kerala Agricultural University with effect from 1.5.1973.

5. Project Title: : All India Co-ordinated Spices and Cashewnut Improvement Project.

6. Objectives:-

One of the major objectives of the Scheme is to bring about overall increase in production of Cashewnut in the state by evolving high-yielding varieties and to work out the optimum manurial and cultural schedules to increase the yield in existing gardens. The scheme also aims to standardise suitable vegetative propagation methods in Cashew for quick multiplication of types

-:2:-

identified as high-yielding and also to recommend suitable remedial measures for the control of major pests and diseases attacking the crop.

The project envisages the collection and maintenance of germ-plasm for Cashew consisting of both indigenous and exotic types for utilisation in the breeding programmes.

7. Present staff Position:

Name of sanctioned Post	Names of Personnel	Date of joining	Recruitment position of Vacant posts.
(1)	(2)	(3)	(4)
1. Agronomist (Hort)/ Assoc. Professor	V.K.Damodaran	1.6.72 to 18.9.75	No post is vacant.
	K.K.Vidyadharan	19-9-75	
2. Senior Research Asst/ Junior Instructor	V.K.Mallika	8-4-75	
3. Jr.Technical Asst/Agricult- ural Demonst- rator	V.M.Mathew	7-7-74	
8. Total sanctioned grant for the Centre			

Year	Recurring	Non-recurring

9) Total Amount Spent

Year	Recurring	Non-recurring
upto 1973-74	61,384.47	1,700.00
1974-75	51,320.05	NIL
1975-76	48,857.93	NIL

10) Approved Technical Programme:-

a) For the Whole Period:-

The following items of work have been included in the technical programme for the whole period.

- i) Collection of germ-plasm and breeding.
- ii) Studies on vegetative propagation with emphasis on standardisation of technique for air-layering and budding.
- iii) Nutritional studies.
- iv) Physiological and Plant Growth regulator studies with emphasis on securing increased fruit set and minimising post set drop.
- v) Investigations on Agro-techniques such as spacing, inter-cropping etc.

- vi) Research on Plant Protection with emphasis on "Flower Scorch", "Die back" etc:
  - vii) Technological research on extraction of Vitamin C quality studies on shell oil, processing etc: (At Vittal and Bapatla Centres only)
- b) Programme for 1975-76 as approved in the last workshop meeting.
- i) Germ-plasm collection and description of types of collected.
  - ii) Standardisation of seedling selection (Vittal Vridhachalam and Bapatla)
  - iii) Comparative yield trial with existing high-yielders.
  - iv) Hybridization and selection.
  - v) Propagation trial
  - vi) Studies on nutrient removal by the crop (Vittal and Bapatla)
  - vii) NPK fertilizer experiment.
  - viii) Pruning trial (Vridhachalam and Vittal)
  - ix) Hormonal application to increase fruit-set in Cashew.

#### 11. Results:

##### Seasonal Conditions-

The rainfall received during the year under report was highly erratic. Heavy showers were received during September October and November 1975. From December to March there was no rainfall. During this long dry spell, the Vegetative propagation trial was suspended due to

very limited success. However budding was continued.

The flowering, in general, started late due to late showers received during October and November. The dry period from December to March had naturally very adverse effect on the growth of cashew. During April May and June the rainfall received was again very limited and below normal. Stray flowering was observed during July. When there was continued dry periods. The rainfall data are presented in Appendix-I.

Work done during the year:

The progress achieved under the various trials, during the year, are briefly given below:

Experiment-1. Germplasm Collection and description of types and varieties.

A good germ lasm collection is being maintained at the Cashew Research S ation, Anakkayam. There are 46 clonal types and 42 seedling types in this collect- ion. This includes indigenous types collected from the Cashew-growing tracts of the state and also from the Cashew Research Stations at Ullal, Vengurla and Bapattla. A few exotic types from Brazil, Tanzania, Malayasia, Nigeria and Tanganyika are also there in the collecti n. The yield data and other ancillary characters of these types were recorded. Among the types maintained, the highest yield was recorded by one seedling type, BLA-139-1 (43.084 Kg) followed by BLA-273-1 (19.050 Kg) also another seedling type. Among the clonal tyr the highest yield was obtained for NDR-2-1 (17.5 followed by K-19-1 (15.965 Kg). In the s,

H.3-17 gave the maximum yield of 15.425 Kg. followed by H-3-12 (13.99 Kg) Both these trees are the P1 Progenies of a cross between Tree No.30 of Kottarakkara Station (A Mangalore type) and Brazil.18. The yield data of promising types which yielded above 10 Kg. nuts during 1975-76 are given below:

TABLE-1

Type No.	Year of Planting	Yield in 1975-76 Kg	Mean yield for last 5 yrs. (Kg)	Highest yield recorded (Kg)	Rem- arks

The Yield of individual trees of the germplasm collection obtained during 1975-76 along with their performance during last five years are furnished in appendix II.

An extensive survey and screening of the Government Cashew Plantation at Kasragod was conducted by visiting plantations at Muliyar, Adhur, Periya and private gardens at Nileswar and Panniyur to select promising types for the germplasm collection for the Mannuthy Centre. As a result of this Survey 69 types were collected during March 1976. The number of types collected from each centre are given below:

Muliyar	-	29	Types
Adhur	-	26	"
Periya	-	9	"
Nileswar	-	4	"
Panniyur	-	1	"

-----  
69      These types have been raised in the  
===== nursery.

Experiment No:2      Standardisation of seedling selection  
in cashew:-

This item of work is not included in the Technical programme of this station.

Experiment No.3      Comparative yield trial with existing  
high-yielders.

In this trial seedlings of 16 types selected from four Cashew Research Stations of Bapatla Vengurla, Vridhachalam and Anakkayam based on yield performance, have been included for comparison. The following are the types included in the study.

- |              |   |                                     |

Spacing : 8 x 8 meters

Date of

Planting : September 1973

The height, girth spread and number of branches of all these trees were recorded. The number of nuts harvested, the yield in grams recorded from individual trees, treatment wise and the shel ing percentage etc: are given in Appendix III. The maximum yield of 1.650 Kg. raw nuts was collected from tree No.1213 which is a selection from Vridhachalam. This was the third year of orchard life of these trees. The mean yield and other ancillary data of these 16 types are presented in Table II given below:

TABLE-II

Serial Number.	Name of the type	Number of trees flowered out of 27.	No. of trees yielded out of 27.			Mean yield per tree	Maximum yield obtained from a single tree(gm)	Mean wt. of a single nut (Gram)	Mean Shelling percentage.
			No. of trees	No. of nuts.	Wt. of nuts in grams.				
1	ANSUR - 1	19	8	24	115	515	4.6	25.5	
2	VENGURLA-36-3	23	17	50	344	627	4.8	27.8	
3	SAWANTWADI	24	19	35	156	692	4.4	29.7	
4	VENGURLA-37-3	25	21	32	149	437	4.6	28.3	
5	T 1 - BLA	20	12	12	70	272	5.8	31.0	
6	T40- BLA	24	16	24	110	393	4.6	28.4	
7	T56- BLA	19	14	33	184	839	5.6	29.0	
8	T.273-BLA	17	5	8	43	127	5.1	20.0	
9	M/10-4	26	16	24	124	283	5.2	31.0	
10	M/6-1	22	13	91	474	1650	5.2	28.1	
11	K-27-1	18	14	55	293	1170	4.5	29.2	
12	M-76-1	23	16	48	226	945	4.7	29.1	
13	H-4-7	23	19	22	118	990	5.3	28.3	
14	K-10-2	22	17	45	282	1607	6.3	29.2	
15	BLA-139-1	22	11	17	92	659	5.4	29.0	
16	BLA-256-1	23	12	17	74	175	4.3	27.7	

Among the 16 types studied, Vengurla-37-3 had the maximum number of yielding trees i.e. 21 out of 27 trees, while T-273 of BLA had the least number of yielding trees i.e. only five trees out of 27 Nos. Sex ratio of all these sixteen types was studied by selecting one tree from each replication. Four panicles

-:11:-

from four sides of the trees were selected and daily counts of male and perfect flowers were recorded. The study showed that among the 16 types compared Vengurla-37-3 had the highest percentage of perfect flowers ie (37.29), followed by K-27-1 (33.15). The type K-10-2 of Anakkayam had the lowest percentage of Sex ratio (1.78). The data are presented in Appendix-IV.

Another comparative yield trial, using the 16 best yielders of the Cashew Research Station, Anakkayam, based on the yield performance for five years, was laid out at Anakkayam during August 75. In this trial, only clonal progenies have been used. In order to test the performance of these varieties in more than one location, a similar trial has been laid out at the Mannuthy Campus on 18-7-1975 using clonal progenies. The details of the trial are given below:

Design : R.B.D  
Treatments : Sixteen  
Replications Three  
No. of plants/  
treatment Four  
spacing 7.5 x 7.5 metres  
Date of  
planting 18-7-75.

- 15) H-3-13
- 16) Local

A count taken during March 1976 showed that there is only 50% survival of the layers planted. The gaps will be filled up during this season when fresh layers will be brought from Anakkayam.

#### Experiment 4. Hybridization and Selection

The hybridization work in Cashew was started in 1963 at the Cashew Research Station, Anakkayam. Crosses were effected mainly with the object of increasing nut size, and overall yield performance with short-flowering phase. The selections were made from the F<sub>1</sub> progenies. The yield data of the hybrid progenies show that H-3-17 has maintained its lead over other progenies, in respect of yield during 1975-76, followed by H-3-12 and H-4-17.

The following fresh crosses were made during 1975-76 at Mannathy.

<u>Female Parent</u>	<u>Male Parent</u>	<u>No. of F1 seeds harvested</u>

seeds

The F1 have already been raised in the nursery and some of them have failed to germinate. The F1 progenies will be planted during this season.

Experiment. 5 Propagation studies.

To standardise the technique for budding, Veener-grafting and side-grafting in Cashew, monthly trials were conducted during the year 1975-76. In general, the

percentage of success was found to be higher during the monsoon periods both for Veneer-grafting and side-grafting. The percentage of success was much less in the case of budding. Precuring the twigs, one week before was found to be beneficial than selecting fresh twigs. The results are presented in table 3 given below:-

TABLE III

	<u>Month</u>	<u>No.of grafted</u>	<u>No.sprouted</u>	<u>% of success</u>
Side grafting	July 75	50	40	80
Veneer grafting	"	50	41	82
Budding	"	50	6	12
Side-grafting	Aug. 75	50	44	88
Veneer-grafting	"	50	32	64
Budding	"	50	13	26
Side-grafting	Sept.75	50	32	64
Veneer-grafting	"	50	44	88
Budding	"	50	13	26
Side-grafting	Oct. 75	50	26	56
Veneer-grafting	"	50	11	22
Budding	"	50	18	36
Side grafting	Nov. 75	50	10	20
Veneer-grafting	"	50	nil	nil
Budding	"	50	5	10
Side-grafting	Dec. 75	50	2	4
Veneer grafting	"	50	nil	nil
Budding	"	50	8	16
Side-grafting	June 76	50	2	4
Veneer-grafting	"	50	1	2
Budding	"	50	20	40

-:15:-

During the period from January to May no side-grafting and Veneer-grafting were done due to the dry weather prevailed. Even during the month of June the percentage of success was very poor in the case of both Veneer and side-grafting due to the dry weather conditions. However, budding was found to be successful to some extent during summer months as shown in the table given below:

<u>Month</u>	<u>No.of plants budded.</u>	<u>No.sprouted</u>	<u>Percentage establis-hed</u>
February 76	50	14	28
March 76	50	8	16
April 76	50	10	20
May 76	50	11	22

Experiment.6

Studies on nutrient removal

This experiment is not included in the programme of work of this Station.

Experiment.7

N.P.K. Trial on Cashew.

This trial was laid out at Mannuthy, during October, 1973 using the seedlings of a single tree of the Cashew Research Station, Anakkayam. In this experiment three levels of Nitrogen, Phosphoric acid and Potash are tried in a confounded factorial design.

Design	:	3 <sup>3</sup> confounded factorial
Treatments	:	27 Nos.
Spacing	:	8x8 metres. with border rows for each treatment.
No.of trees/treatment:	9	
No.of Replications	:	2
Seedlings used	:	T20
Date of Planting	:	30-10-1973.

At present the trees in this trial are given a uniform dose of fertilizers until the trees start bearing. This is according to a decision taken in a previous workshop meeting. During the first four years, a uniform dose of fertilizers will be applied. The differential dose of fertilizers is to be applied from the 5th year onwards. The fertilizers are now applied in two split doses, one during June-July and the other during August-September. The trees were protected from tea-mosquits by spraying endosulfan. Some of the trees have already started bearing and the yield from individual trees has been recorded. Growth measurements such as girth, height, spread and the number of branches of all the trees have also been recorded once in every year.

Experiment No.8      Pruning trial.

This experiment is not included in the technical programme of this centre.

Experiment 22.      Application of hormones to increase Fruit-set.

This trial was continued for the third year in succession, using three plant hormones in different concentrations. The object of the study was to examine whether aqueous sprays of plant regulators on panicles can increase the fruit-set in Cashew by controlling the premature fruit-fall. The following plant-regulators were used in the trial.

-:17:-

- (1) Indol Acetic Acid 50 p.p.m.
- (2) Naphthalene Acetic Acid 10 p.p.m.
- (3) " " 20 p.p.m.
- (4) 2,4-D 5 p.p.m
- (5) " 10 p.p.m
- (6) Water spray
- (7) No.spray

Aqueous solutions of the above chemicals were sprayed on the whole trees, when the trees were in full bloom and the nuts were just started setting. There were two trees under each treatment with tree replications. The spray was repeated 15 days after the first spray. Twentyfive panicles were tagged at random on four sides of each tree immediately after the first spray. The visible number of nuts already set on each panicle at the time of the first spray. the number of nuts set subsequently the no. of nuts dropped and the final number of nuts harvested from each panicle are record d. The data are presented in table IV given below:

TABLE IV

Treat- ment No.	Treatment	Mean No. of fruits set	Mean No. of fruits dropped	Mean No. of Nuts harvest- ed	of harvest- ed nuts to total set.
1	IA.A.50 ppm	255.6	186.3	69.3	27.17
2	NAA. 10 ppm	151.0	116.3	34.6	22.91
3	N A. 20 ppm	185.3	119.3	66.0	28.04
4	2,4-D 5 ppm	183.6	137.3	46.3	25.21

6	Water spray	231.3	149.3	82.0	35.45
7	Control(No spray)	24.3	147.3	67.0	31.20
CD at 5%		Not sig- ificant	Not sig- nificant	Not sig- nificant	Not sig- nificant

-:18:-

There was no significant yield difference among the treatments. However, the maximum percentage of nuts harvested was from trees received water sprays. This trial was first started during 1973-74. During 1973-74 significant yield increase was recorded in treatments receiving Indol Acetic Acid (50 ppm) and Naphthalene acetic acid (10 p.p.m.). However when the trial was repeated during 1974-75 and during 1975-76 no significant yield difference was noticed. Another trial using still higher concentrations of the same growth regulators was conducted at Marmuthy. In this case only selected panicles were sprayed instead of the whole tree. Further all the 12 treatments were tried in different panicles of the same tree. In all, there were 12 treatments and six replications.

Treatments:

- 1) N.A.A 10 p.p.m      (2) N.A.A. 20 p.p.m.
- 3) N.A.A 30 p.p.m      (4) N.A.A. 40 p.p.m.
- 5) I.A.A 50 p.p.m      (6) I.A.A.100 p.p.m.
- 7) I.A.A150 p.p.m      (8) 2,4-D. 5 p.p.m.
- 9) 2,4-D 10 p.p.m      (10) 2,4-D. 15 p.p.m.
- 11) Water spray      (12) No spray (control)

The study showed that the difference in setting percentage was mainly due to variation between trees. There was scorching effect when higher concentrations were tried especially in IAA.150 p.p.m. The results are given in Appendix V.

## 12. Technical Summary:

Besides maintaining the already existing collection of germplasm at the Cashew Research Station, Anakkayam, 69 new types were added by conducting extensive survey of the Cashew growing tracts of Cannanore District including the Government plantations at Kasragod. Among the types maintained at Anakkayam an indigenous seedling selection from Bapatla (BLA-139-1) continued to give the highest yield of 43<sup>Kg</sup>/huts. followed by another Bapatla type BLA-273-1 (19 Kg).

Among the clonal types NDR-2-1 recorded the highest yield (17.59 Kg) followed by a Kottarakkara type, K-19-1 (15.96). In the case of hybrid progenies, H-3-17 (15.42) Kg. and H-3-12 (13.99Kg) were the top yielders of the year. Both these plants are selections from a cross between Tree No.30 of Kottarakkara and Brazil-18.

The trees in the comparative yield trial planted in September 1973 using seedlings of 16 promising types selected from four Research Stations of Anakkayam, Vridhachalam Vengurla and Bapatla have started bearing. Yield data of these trees were recorded and their seedling percentage worked out. The growth measurements of all these trees were also recorded. The type T<sub>1</sub>-RIA and M/10-4 recorded the highest shellling percentage viz. 51%. Among the 16 types compared, Vengurla-37-3 had the maximum number of bearing trees i.e. 21 out of 27 trees while the lowest number of bearing trees were found in BLA-273 with only 5 trees, out of 27 Nos. The maximum yield was recorded by a Vridhachalam type M/6-1. The study of the

sex-ratio of these types showed that Vengurla-37-3 had the highest percentage of perfect flowers (37.29) followed by K-27-1 (33.15). It varied from 1.78 in the case of K-10-2 (a Kottarakkara type) to 37.29 in the case of Vengurla 37-3 (a Maharashtra type).

In the case of Comparative yield Trial No.2, planted in July 1975 using clonal progenies of 16 best yielders of Anakkayam Station, more than 50% of the plants had failed to establish. Action has been taken to fill up the gaps with fresh layers.

Among the several sets of crosses made at Anakkayam from 1963 onwards, the hybrid H-3-17 (1.30 Kottarakkara x Brazil 18) has maintained its superiority in yield over other cross progenies during the period under report. This was followed by H-3-12 and H-4-7. Fresh hybridization programme was also taken up at Mannuthy centre during February 1976 and 19 sets of crosses were made during 1975-76. The F<sub>1</sub> seeds from these crosses have been raised in the nursery.

In the Vegetative propagation trial conducted to standardise the technique, monthly trials were done from May 1975 onwards to December 1975. In the summer months, only budding was continued. The percentage of establishment was more in the case of side-grafting and Veneer-grafting during monsoon periods. In the case of budding the establishment was comparatively lower. A good number of trees in the N.P.K trial planted during October 1973 had started bearing. The growth measurements of all the trees coming under N.P.K trial were

206915

-:21:-

recorded along with individual tree-yield. All the trees in this trial were given a uniform dose of fertilizers in two split doses, one during June 1975 and the second dose during September 1975.

In the hormone trial conducted to study the effect of IAA, NAA, and 2,4-D in different concentrations on the fruit-set of cashew, there was no significant yield difference among the treatments. This confirms the results obtained during the previous year for the same trial. This study has now completed three years. Only during the first year of trial increased fruit-set and total yield was obtained when IAA 50 p.p.m and NAA 10 p.p.m were sprayed. During the subsequent two years there was no significant yield difference among the treatments.

13. Remarks of the workshop on the last year's report and the action taken thereon:-

NIL

14. Additional Information, if any.

Even though intercropping in cashew is not included in the Technical programme for this station, the whole area has been put under cassava, leaving 2 metre radius from the base of the trees.

Date and Signature of the Head of the Institution.
